

How to Make Changes in Router Settings

Set up your TP-Link router quickly

Are you in need of creating the personal network and searching for the best wireless router to make the network? Now we have the proper solution for you. Among all router models currently available, the TP-LINK wireless router is probably the very best ones. It has a multitude of benefits for the ordinary user and that is one good reason for its global recognition. Since this is a wireless router, feel free to use various wireless devices with it.

Installing the wireless router to get the internet connection

For those who have bought the TP-LINK router for your network system, you have to correctly install it to use it. An effective router setup is essential if you'd like to have a solid internet access. At this moment, you'll see the clear way of setting up the TP link router with the wi-fi settings in the most effective way.

The initial thing should be to look for the best wireless router to meet your requirements.

Once you accomplish this, prepare the devices you intend to use in your wireless network. A lot of the notebooks as well as the devices that are available in the present days have the characteristics for the wireless network. If the device lacks a Wi-Fi internet connection capacities it's fine to use a Wi-Fi card.

After that you must set your modem. For this purpose, it is advisable to power down the modem and disconnect the Ethernet cable from the personal computer. In that case, connect in to the wireless modem and turn it on.

There will be 4 blinking led lights on the modem in case you have done everything the right way. After that, you must configure the configurations.

Installing the TP link router with the configurations

Prior to starting setting up your router you need to check a few things.

First you should open your web browser.

In that case, you need to enter the default IP of your router in the address bar of your web browser. Generally, the default Router IP for TPLINK routers is 192.168.1.2.

The router logon page will appear for those who have typed the correct Default IP. Following that, you'll need to type in the default wireless router account important information.

Typically, the TP-LINK wireless router has both the account details as the 'admin' and so it is easy to provide it on the sign in window. Following that, you must click on OK on the page to log in your wireless router. From now on, you could start setting up the router.

Yet, you can also press basic on the Wi-Fi menu to configure the configuration settings. It's also possible to click on Enable Wi-Fi and Network name broadcast to set-up wireless internet.

After that, you have to provide the nickname for your wireless router in the Network name box. Picking the appropriate area is crucial.

It is recommended to save these details for some other time. This is because that you must get the security options once more and need to give the username and passwords. Just in case, if you have overlooked those things, you should reset your wireless router all over again.

Then you have to go to the Control Panel and click on Network and Sharing. This allows the user to connect other devices on the net. You may even share documents in your computer network.

You may also configure the TP-LINK router with such settings. As you already know the IP 192.168.1.2 is very important for computer network setup. Actually, it's the default IP address for the TP link wireless router which is presented to the user when it's bought from the makers.
