

Manage Apache Download Speed And Traffic Limits With mod_cband

In this tutorial I will describe how to install and configure mod_cband on an Apache2 web server. mod_cband is an Apache 2 module which provides bandwidth quota and throttling. It solves the problem of limiting users' and virtualhosts' bandwidth usage. The current version can set virtualhosts' and users' bandwidth quotas, maximal download speed, requests-per-second speed and the maximal number of simultaneous IP connections.

mod_cband can be used by hosting companies, which would like to limit data transfer for their users, such as "10 GB of traffic per month".
